Package 'codebook'

November 23, 2018

Title Automatic Codebooks from Survey Metadata Encoded in Attributes

Description Easily automate the following tasks to describe data frames:

summarise the distributions of scales and items graphically and using descriptive statistics, compute reliabilities (internal consistencies, retest, multilevel) for psychological scales, combine this information with metadata (such as item labels and labelled values) that is derived from R attributes.

To do so, the package relies on 'rmarkdown' partials, so you can generate HTML, PDF, and Word documents. Codebooks are also available as tables (CSV, Excel, etc.).

The metadata and codebooks are also available at your fingertips via RStudio Addins.

Version 0.6.3

Depends R (>= 3.0.1)

aggregate_and_document_scale

Index

Aggregate variables and remember which variables this were

asis_knit_child 3

Description

The resulting variables will have the attribute scale_item_names containing the basis for aggregation. Its label attribute will refer to the common stem of the aggregated variable names (if any), the number of variables, and the aggregation function.

Usage

```
aggregate and document scale (items, fun = rowMeans, stem = NULL)
```

Arguments

items	data.frame of the items that should be aggregated
fun	aggregation function, defaults to rowMeans with na.rm = FALSE
stem	common stem for the variables, specify if it should not be auto-detected as the
	longest common stem of the variable names

Examples

asis_knit_child

Knit a child document and output as is (render markup)

Description

This slightly modifies the knitr::knit_child() function to have different defaults.

- the environment defaults to the calling environment.
- the output receives the class knit_asis, so that the output will be rendered "as is" by knitr when calling inside a chunk (no need to set results='asis' as a chunk option).
- defaults to quiet = TRUE

Usage

```
asis_knit_child(input = NULL, text = NULL, ..., quiet = TRUE,
    options = NULL, envir = parent.frame(), use_strings = TRUE)
```

Arguments

```
if you specify a file path here, it will be read in before being passed to knitr (to
input
                 avoid a working directory mess)
                 passed to knitr::knit_child()
text
                 passed to knitr::knit_child()
. . .
quiet
                 passed to knitr::knit_child()
                 defaults to NULL.
options
                 passed to knitr::knit_child()
envir
                 whether to read in the child file as a character string (solves working directory
use_strings
                 problems but harder to debug)
```

4 bfi

Details

Why default to the calling environment? Typically this function defaults to the global environment. This makes sense if you want to use knit children in the same context as the rest of the document. However, you may also want to use knit children inside functions to e.g. summarise a regression using a set of commands (e.g. plot some diagnostic graphs and a summary for a regression nicely formatted).

Some caveats:

• the function has to return to the top-level. There's no way to cat () this from loops or an if-condition without without setting results='asis'. You can however concatenate these objects with paste.knit_asis()

Examples

```
## Not run:
# an example of a wrapper function that calls asis_knit_child with an argument
# ensures distinct paths for cache and figures, so that these calls can be looped in para
regression_summary <- function(model) {
   hash <- digest::digest(model)
   options <- list(
      fig.path = paste0(knitr::opts_chunk$get("fig.path"), hash, "-"),
      cache.path = paste0(knitr::opts_chunk$get("cache.path"), hash, "-"))
   asis_knit_child("_regression_summary.Rmd", options = options)
}
## End(Not run)</pre>
```

bfi

Mock BFI data

Description

a small mock BFI dataset with realistic values, exported from formr. The dataset is self-documenting via its attributes.

Usage

bfi

Format

A data frame with 28 rows and 29 variables:

codebook 5

codebook

Generate rmarkdown codebook

Description

Pass a data frame to this function to make a codebook for that dataset. If the dataset has metadata (attributes) set on its variables, these will be used to make the codebook more informative. Examples are item, value, and missing labels. Data frames imported via haven::read_dta(), haven::read_sav(), or from formr.org will have these attributes in the right format. By calling this function inside a knitr code chunk, the codebook will become part of the document you are generating.

Usage

```
codebook(results, reliabilities = NULL, survey_repetition = c("auto",
   "single", "repeated_once", "repeated_many"), survey_overview = TRUE,
   missingness_report = TRUE, metadata_table = TRUE,
   metadata_json = TRUE, indent = "#")
```

Arguments

```
results
                  a data frame, ideally with attributes set on variables
reliabilities
                  a named list with one entry per scale and one or several printable reliability com-
                  putations for this scale. if NULL, computed on-the-fly using compute_reliabilities
survey_repetition
                  defaults to "auto" which is to try to determine the level of repetition from the
                  "session" and "created" variables. Other values are: single, repeated_once, re-
                  peated_many
survey overview
                  whether to print an overview of survey entries, durations (depends on presence
                  of columns session, created, modified, ended, expired)
missingness_report
                  whether to print a missingness report. Turn off if this gets too complicated and
                  you need a custom solution (e.g. in case of random missings).
metadata_table
                  whether to print a metadata table/tabular codebook.
metadata_json
                  whether to include machine-readable metadata as JSON-LD (not visible)
```

Examples

indent.

beginning at h2

```
# will generate figures in a temporary directory
old_base_dir <- knitr::opts_knit$get("base.dir")
knitr::opts_knit$set(base.dir = tempdir())
on.exit(knitr::opts_knit$set(base.dir = old_base_dir))
data("bfi")
bfi <- bfi[, c("BFIK_open_1", "BFIK_open_1")]
md <- codebook(bfi, survey_repetition = "single", metadata_table = FALSE)</pre>
```

add # to this to make the headings in the components lower-level. defaults to

```
codebook_browser Browse and search codebook
```

Description

Usable as an Addin in RStudio. You can select it from a menu at the top, when this package is installed. If you're currently selecting the name of a data frame in your source code, this will be the dataset shown by default. If you don't select text, you can pick a dataset from a dropdown. You can add a keyboard shortcut for this command by following the instructions by RStudio. How about Cmd+Ctrl+C?

Usage

```
codebook_browser(data = NULL, labels_only = FALSE,
   title = "Codebook metadata", viewer = rstudioapi::viewer)
```

Arguments

data the dataset to display. If left empty will try to use selected text in RStudio or

offer a dropdown

labels_only defaults to false called with TRUE from label_browser()

title title of the gadget

viewer defaults to displaying in the RStudio viewer

```
codebook_component_scale
```

Codebook component for scales

Description

Codebook component for scales

Usage

```
codebook_component_scale(scale, scale_name, items, reliabilities,
  indent = "##")
```

Arguments

scale a scale with attributes set scale_name the variable name of this scale

items a data.frame with the items constituting the scale

reliabilities

a list with one or several results from calls to psych package functions for com-

puting reliability

indent add # to this to make the headings in the components lower-level. defaults to

beginning at h2

Examples

```
# will generate figures in a temporary directory
old_base_dir <- knitr::opts_knit$get("base.dir")
knitr::opts_knit$set(base.dir = tempdir())
on.exit(knitr::opts_knit$set(base.dir = old_base_dir))
data("bfi")
bfi <- bfi[,c("BFIK_open", paste0("BFIK_open_", 1:4))]
codebook_component_scale(bfi[,1], "BFIK_open", bfi[,-1],
    reliabilities = list(BFIK_open = psych::alpha(bfi[,-1])))</pre>
```

```
codebook_component_single_item
```

Codebook component for single items

Description

Codebook component for single items

Usage

```
codebook_component_single_item(item, item_name, indent = "##")
```

Arguments

item an item with attributes set

item_name the item name

indent add # to this to make the headings in the components lower-level. defaults to

beginning at h2

Examples

```
# will generate figure in a temporary directory
old_base_dir <- knitr::opts_knit$get("base.dir")
knitr::opts_knit$set(base.dir = tempdir())
on.exit(knitr::opts_knit$set(base.dir = old_base_dir))
data("bfi")
codebook_component_single_item(bfi$BFIK_open_1, "BFIK_open_1")</pre>
```

codebook_items

Tabular codebook

Description

Renders a tabular codebook including attributes and data summaries. The table is generated using DT::datatable() and can be exported to CSV, Excel, etc.

Usage

```
codebook_items(results, indent = "##")
```

Arguments

results a data frame, ideally with attributes set on variables

indent add # to this to make the headings in the components lower-level. defaults to

beginning at h2

Examples

```
data("bfi")
## Not run:
# doesn't show interactively, because a html widget needs to be registered
codebook_items(bfi)
## End(Not run)

codebook_missingness

Codebook missingness
```

Description

An overview table of missingness patterns generated using md_pattern().

Usage

```
codebook_missingness(results, indent = "##")
```

Arguments

results a data frame

indent add # to this to make the headings in the components lower-level. defaults to

beginning at h2

Examples

```
data("bfi")
codebook_missingness(bfi)
```

```
codebook_survey_overview
```

Codebook survey overview

Description

An overview of the number of rows and groups, and of the durations participants needed to respond (if those data are available).

Usage

```
codebook_survey_overview(results, survey_repetition = "single",
  indent = "##")
```

codebook_table 9

Arguments

results a data frame which has the following columns: session, created, modified, ex-

pired, ended

survey_repetition

defaults to single (other values: repeated_once, repeated_many). controls whether

internal consistency, retest reliability or multilevel reliability is computed

indent add # to this to make the headings in the components lower-level. defaults to

beginning at h2

Examples

```
# will generate figures in a figure/ subdirectory
data("bfi")
codebook_survey_overview(bfi)
```

codebook_table

Codebook metadata table

Description

will generate a table combining metadata from variable attributes with data summaries generated using skimr::skim_to_wide()

Usage

```
codebook_table(results)
```

Arguments

results a data frame, ideally with attributes set on variables

Examples

```
data("bfi")
codebook_table(bfi)
```

```
compute_reliabilities
```

Compute reliabilities

Description

If you pass the object resulting from a call to formr_results to this function, it will compute reliabilities for each scale. Internally, each reliability computation is passed to a <code>future::future()</code>. If you are calculating multilevel reliabilities, it may be worthwhile to parallelise this operation using <code>future::plan()</code>. If you don't plan on any complicated parallelisation, you probably do not need to call this function directly, but can rely on it being automatically called during codebook generation. If you do plan to do that, you can pass the results of this operation to the codebook function.

10 detect_missings

Usage

```
compute_reliabilities(results, survey_repetition = "single")
```

Arguments

```
results a form results table with attributes set on items and scales survey_repetition defaults to "single". Can also be "repeated once" or "repeated many"
```

Examples

```
data("bfi", package = "codebook")
reliabilities <- compute_reliabilities(bfi)</pre>
```

detect_missings

Detect missing values

Description

SPSS users frequently label their missing values, but don't set them as missing. This function will rectify that for negative values and for the values 99 and 999 (only if they're 5*MAD away from the median). Using different settings, you can also easily tag other missings.

Usage

```
detect_missings(data, only_labelled_missings = TRUE,
  negative_values_are_missing = TRUE, ninety_nine_problems = TRUE,
  learn_from_labels = TRUE, missing = c(), non_missing = c(),
  vars = names(data), use_labelled_spss = FALSE)
```

Arguments

```
data
                 the data frame with labelled missings
only_labelled_missings
                 don't set values to missing if there's no label for them
negative_values_are_missing
                 by default we label negative values as missing
ninety_nine_problems
                 SPSS users often store values as 99/999, should we do this for values with
                 5*MAD of the median
learn_from_labels
                 if there are labels for missings of the form [-1] no answer, set -1 in the
                 data to the corresponding tagged missing
missing
                 also set these values to missing (or enforce for 99/999 within 5*MAD)
non_missing don't set these values to missing
                 only edit these variables
use_labelled_spss
```

the labelled_spss class has a few drawbacks. Since R can't store missings like -1 and 99, we're replacing them with letters unless this option is enabled. If you prefer to keep your -1 etc, turn this on.

detect_scales 11

detect_scales Det

Detect item scales

Description

Did you create aggregates of items like this scale <- scale_1 + scale_2R + scale_3R? If you run this function on a dataset, it will detect these relationships and set the appropriate attributes. Once they are set, the codebook package can perform reliability computations for you.

Usage

```
detect_scales(data, quiet = FALSE)
```

Arguments

data the data frame
quiet defaults to false. Suppresses messages about found items.

Examples

```
bfi <- data.frame(matrix(data = rnorm(500), ncol = 5))
names(bfi) <- c("bfi_e1", "bfi_e2R", "bfi_e3", "bfi_n1", "bfi_n2")
bfi$bfi_e <- rowMeans(bfi[, c("bfi_e1", "bfi_e2R", "bfi_e3")])
bfi <- detect_scales(bfi)
bfi$bfi_e</pre>
```

ended

How many surveys were ended?

Description

Just a simple to check how many times a survey (e.g. diary) was finished. It defaults to checking the "ended" variable for this.

Usage

```
ended(survey, variable = "ended")
```

Arguments

```
survey which survey are you asking about?
variable which variable should be filled out, defaults to "ended"
```

```
survey \leftarrow data.frame(ended = c("2016-05-28 10:11:00", NA, "2016-05-30 11:18:28")) ended(survey = survey)
```

12 has_label

expired

How many surveys were expired?

Description

Just a simple to check how many times a survey (e.g. diary) has expired (i.e. user missed it). It defaults to checking the "expired" variable for this.

Usage

```
expired(survey, variable = "expired")
```

Arguments

survey which survey are you asking about?

variable which variable should be filled out, defaults to "expired"

Examples

```
survey <- data.frame(expired = c(NA, "2016-05-29 10:11:00", NA))
expired(survey = survey)</pre>
```

has_label

Has label

Description

Has label

Usage

```
has_label(x)
```

Arguments

х

a vector

```
example("labelled", "haven")
has_label(x)
```

has_labels 13

has_labels

Has labels

Description

Has labels

Usage

```
has_labels(x)
```

Arguments

Х

a vector

Examples

```
example("labelled", "haven")
has_labels(x)
```

knit_print.alpha

Pretty-print a Cronbach's alpha object

Description

```
Turn a psych::alpha() object into HTML tables.
```

Usage

```
knit_print.alpha(x, indent = "#####", ...)
```

Arguments

```
x a psych alpha object
```

indent add # to this to make the headings in the components lower-level. defaults to

beginning at h5

... ignored

```
example("alpha", "psych")
knitr::knit_print(a4)
```

14 knit_print.multilevel

Description

Just prints the normal output of stats::cor.test().

Usage

```
knit_print.htest(x, indent = "#####", ...)
```

Arguments

```
x a psych alpha object add # to this to make the headings in the components lower-level. defaults to beginning at h5
```

... ignored

Examples

```
knitr::knit_print(cor.test(rnorm(100), rnorm(100)))
```

```
knit_print.multilevel
```

Print a psych::multilevel.reliability() object for knitr

Description

```
Just prints the normal output of psych::multilevel.reliability().
```

Usage

```
knit_print.multilevel(x, indent = "#####", ...)
```

Arguments

```
x a psych alpha object
```

indent add # to this to make the headings in the components lower-level. defaults to

beginning at h5

... ignored

```
example("mlr", "psych")
knitr::knit_print(mg)
```

label_browser 15

1 - 1 - 1	browser	
Tabet	DIOWSEL	

Browse and search variable and value labels

Description

Same as the codebook_browser(), but doesn't show data summaries and additional attributes.

Usage

```
label_browser(data = NULL, viewer = rstudioapi::viewer)
```

Arguments

data the dataset to display. If left empty will try to use selected text in RStudio or

offer a dropdown

viewer defaults to displaying in the RStudio viewer

```
label_browser_static
```

Browse and search variable and value labels

Description

Same as the <code>codebook_browser()</code>, but doesn't show data summaries and additional attributes. This yields a static table, so you can continue to edit code while viewing the labels, but you cannot switch the dataset via a dropdown menu.

Usage

```
label_browser_static(data = NULL, viewer = rstudioapi::viewer)
```

Arguments

data frame. if left empty, will use the text you currently select in RStudio as the

label or the first data frame in your environment

viewer where to show. defaults to viewer tab

```
label_browser_static(bfi)
```

```
likert_from_items Derive a likert object from items
```

Description

Pass a data.frame containing several items composing one scale, get a likert::likert() object, which you can plot. Intelligently makes use of labels and value labels if present.

Usage

```
likert_from_items(items)
```

Arguments

items

a data frame of items composing one scale

Examples

```
data("bfi", package = "codebook")
open_items <- paste0("BFIK_open_",1:4)
graphics::plot(likert_from_items(bfi[, open_items]))</pre>
```

```
load_data_and_render_codebook
```

Render codebook based on file

Description

Submit a data file and an rmarkdown template as a file to generate a codebook. Used chiefly in the webapp.

Usage

```
load_data_and_render_codebook(file, text, remove_file = FALSE, ...)
```

Arguments

md_pattern 17

md_pattern

Missing data patterns

Description

Generate missingness patterns using mice::md.pattern(), with options to reduce the complexity of the output.

Usage

```
md_pattern(data, only_vars_with_missings = TRUE, min_freq = 0.01)
```

Arguments

```
data the dataset
only_vars_with_missings
defaults to TRUE, omitting variables that have no missings
min_freq minimum number of rows to have this missingness pattern
```

Examples

```
data("nhanes", package = "mice")
md_pattern(nhanes)
md_pattern(nhanes, only_vars_with_missings = FALSE, min_freq = 0.2)
```

metadata_jsonld

Metadata as JSON-LD

Description

Echo a list of a metadata, generated using metadata_list() as JSON-LD in a script tag.

Usage

```
metadata_jsonld(results)
```

Arguments

results

a data frame, ideally with attributes set on variables

```
data("bfi")
metadata_jsonld(bfi)
```

18 modified

metadata_list

Metadata from dataframe

Description

Returns a list containing variable metadata (attributes) and data summaries.

Usage

```
metadata_list(results)
```

Arguments

results

a data frame, ideally with attributes set on variables

Examples

```
data("bfi")
md_list <- metadata_list(bfi)
md_list$variableMeasured[[20]]</pre>
```

modified

How many surveys were modified?

Description

Just a simple to check how many times a survey (e.g. diary) has expired (i.e. user missed it). It defaults to checking the "expired" variable for this.

Usage

```
modified(survey, variable = "modified")
```

Arguments

survey which survey are you asking about?

variable which variable should be filled out, defaults to "modified"

```
survey <- data.frame(modified = c(NA, "2016-05-29 10:11:00", NA))
modified(survey = survey)</pre>
```

paste.knit_asis

Description

Helper function for $knit_asis$ objects, useful when e.g. $asis_knit_child$ () was used in a loop.

Usage

```
paste.knit_asis(..., sep = "\n\n", collapse = "\n\n")
```

Arguments

Details

Works like base::paste() with both the sep and the collapse argument set to two empty lines

Examples

```
paste.knit_asis("# Headline 1", "## Headline 2")
```

```
plot_labelled Plot labelled vector
```

Description

Plot a labelled vector, making use of the variable name, label and value labels to make the plot more readable. This function also works for other vectors, but provides little benefit.

Usage

```
plot_labelled(item, item_name = NULL, wrap_at = 50,
    go_vertical = FALSE)
```

Arguments

```
item a vector
item_name item name, defaults to name of first argument
wrap_at the subtitle (the label) will be wrapped at this number of characters
go_vertical defaults to FALSE. Whether to show choices on the Y axis instead.
```

```
data("bfi", package = "codebook")
plot_labelled(bfi$BFIK_open_1)
```

20 rescue_attributes

Description

Print new lines in knit_asis outputs

Usage

```
## S3 method for class 'knit_asis'
print(x, ...)
```

Arguments

```
x the knit_asis object... ignored
```

Description

You can use this function if some of your items have lost their attributes during wrangling Variables have to have the same name (Duh) and no attributes should be overwritten. But use with care. Similar to labelled::copy_labels().

Usage

```
rescue_attributes(df_no_attributes, df_with_attributes)
```

Arguments

```
\label{thm:continuous} $$ $$ the data frame with missing attributes $$ $ df_with_attributes $$ the data frame from which you want to restore attributes $$ $$
```

```
reverse_labelled_values
```

Reverse labelled values reverse the underlying valus for a numeric haven::labelled() vector while keeping the labels correct

Description

Reverse labelled values reverse the underlying valus for a numeric haven::labelled() vector while keeping the labels correct

Usage

```
reverse_labelled_values(x)
```

Arguments

v

a labelled vector

Value

return the labelled vector with the underlying values having been reversed

Examples

```
x <- haven::labelled(rep(1:3, each = 3), c(Bad = 1, Good = 5))
x
reverse_labelled_values(x)</pre>
```

summary.labelled

Summary function for labelled vector

Description

Summary function for labelled vector

Usage

```
## S3 method for class 'labelled'
summary(object, ...)
```

Arguments

```
object a labelled vector
... passed to summary.factor
```

```
example("labelled", "haven")
summary(x)
```

22 zap_attributes

```
summary.labelled_spss
```

Summary function for labelled_spss vector

Description

Summary function for labelled_spss vector

Usage

```
## S3 method for class 'labelled_spss'
summary(object, ...)
```

Arguments

```
object a labelled_spss vector
... passed to summary.factor
```

Examples

```
example("labelled", "haven")
summary(x)
```

zap_attributes

Zap attributes

Description

Modelled on haven::zap_labels(), but more encompassing. By default removes the following attributes: format.spss, format.stata, label, labels, na_values, na_range, display_width

Usage

```
zap_attributes(x, attributes = c("format.spss", "format.sas",
   "format.stata", "label", "labels", "na_values", "na_range",
   "display_width"))
```

Arguments

```
x the data frame or variable

attributes character vector of attributes to zap. NULL if everything (including factor levels etc) should be zapped
```

zap_label 23

Examples

```
bfi <- data.frame(matrix(data = rnorm(300), ncol = 3))
names(bfi) <- c("bfi_el", "bfi_e2R", "bfi_e3")
attributes(bfi$bfi_e1)$label <- "I am outgoing."
attributes(bfi$bfi_e2R)$label <- "I prefer books to people."
attributes(bfi$bfi_e3)$label <- "I love to party."
bfi$bfi_e <- rowMeans(bfi[, c("bfi_e1", "bfi_e2R", "bfi_e3")])
bfi <- detect_scales(bfi, quiet = TRUE) # create attributes
str(zap_attributes(bfi, "label"))
zap_attributes(bfi$bfi_e)</pre>
```

zap label

Zap variable label

Description

Modelled on haven::zap_labels(), zaps variable labels (not value labels).

Usage

```
zap_label(x)
```

Arguments

Х

the data frame or variable

Examples

```
x \leftarrow \text{haven::labelled(rep(1:5, each = 1), c(Bad = 1, Good = 5))} zap\_label(x)
```

zap_labelled

Zap labelled class

Description

```
Modelled on haven::zap_labels(), zaps labelled class (not other attributes).
```

Usage

```
zap_labelled(x)
```

Arguments

Х

the data frame or variable
